Q2. Complete the code below to filter `countData` to exclude genes (i.e. rows) where we have 0 read count across all samples (i.e. columns).

```
remove <- rowSums(countData) == 0
countData <- countData[!remove, ]

Q8: What pathway has the most significant “Entities p-value”? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods? the most significant Entities p-value is Cell cycle Mitotic that is different from KEGG result. The difference in result can be because of variety of database and gene sets.
